

CSCI 1300 - Intro to Computer Programming

Instructor: Fleming/Gupta

Homework 2

Due Sunday, February 4th, by 6 pm

+5% bonus if submitted by Friday February 2nd 11:55 pm,

+2% bonus if submitted by Saturday February 3rd 11:55 pm

This assignment is due **Sunday, February 4th 6pm.**

- **All components (Cloud9 workspace, moodle quiz attempts, and zip file) must be completed and submitted by Sunday, February 4th 6:00 pm for your homework to receive points.**
- Complete submissions (Cloud9 workspace, moodle quiz attempts, and zip file) before **Friday February 2nd 11:55 pm** will receive a 5% bonus, and complete submissions before **Saturday February 3rd 11:55 pm** will receive a 2% bonus.

Objectives:

- Algorithm Design: be able to write a step-by-step pseudocode algorithm to a given problem
- Understand basic programming concepts of: variables, values, assignment, operations, operands, and use them in simple C++ commands
- Understand and practice using `cout` to display text and variables (their values)
- Writing and testing C++ short functions
 - Understand problem description
 - Design your function:
 - come up with a step by step algorithm,
 - convert the algorithm to pseudocode
 - imagine many possible scenarios and corresponding sample runs or outputs
 - Convert the pseudocode into a program written in the C++ programming language
 - Test it in the Cloud9 IDE and submit it for grading on Moodle

Develop in Cloud9: For this assignment, write and test your solution using Cloud9.

Submission: All three steps must be fully completed by the submission deadline for your homework to receive points. Partial submissions will not be graded.

1. ***Share your Cloud 9 workspace with your TA:*** Your recitation TA will review your code by going to your Cloud9 workspace. ***TAs will check the last version that was saved before the submission deadline.***

CSCI 1300 - Intro to Computer Programming

Instructor: Fleming/Gupta

Homework 2

- Create a directory called **Hmwk2** and place all your file(s) for this assignment in this directory.
- [Share your workspace](#) by clicking Share in the upper right hand corner and inviting your TA using their Cloud9 username.

TA Name	Cloud9 Username	TA Name	Cloud9 Username
Akriti Kapur	akritikapur	Monika Tak	mtak
Arcadia(Xiaozhe) Zhang	arcadiaz	Paramjot Singh	param17
Ashwin Sankaralingam	ashwinsankaralingam	Richard Tillquist	riti4538
Bu Sun Kim	busun	Sayali Sonawane	sayalisonawane
Chelsea Chandler	chelseachandler	Yichen Wang	wangyichen5151
Harshini Muthukrishnan	harshini95		

- Make sure to **save** the final version of your code (File > Save). Verify that this version displays correctly by going to File > File Version History.
 - The file(s) should have all of your functions, test cases for the functions in main function(s), and adhere to the style guide. Please read the **Test Cases** and **Style and Comments** sections for more details.
2. **Submit to the Moodle Autograder:** Head over to Moodle to the link **Hmwk 2**. You will find one programming quiz question for each problem in the assignment. Submit your solution for the first problem and press the Check button. You will see a report on how your solution passed the tests, and the resulting score for the first problem. You can modify your code and re-submit (press **Check** again) as many times as you need to, up until the assignment due date. Continue with the rest of the problems.
 3. **Submit a zip file to Moodle:** After you have completed all the questions and checked them on Moodle, **you must submit a zip file with the .cpp file(s) you wrote in Cloud9**. Submit this file going to **Hmwk 2 (File Submission)** on moodle.

Style and Comments (20 points)

Comments (10 points):

- Your code should be well commented. Use comments to explain what you are doing, especially if you have a complex section of code. These comments are intended to help other developers understand how your code works. These comments should begin with two backslashes (//).
- Please also include a comment at the top of your solution with the following format:

```
// Author: CS1300 Fall 2017
// Recitation: 123 - Favorite TA
// Cloud9 Workspace Editor Link: https://ide.c9.io/...
// Homework 2 - Problem # ...
```

CSCI 1300 - Intro to Computer Programming

Instructor: Fleming/Gupta

Homework 2

Algorithm (10 points):

- Remember to include in comments, before the function definition, a description of the algorithm you used for that function.
- This is an example C++ solution to problem 5 of Homework 1. Look at the code and the algorithm description for an example of what is expected.

```
/**
 * Algorithm: that checks what range a given MPG falls into.
 * 1. Take the mpg value passed to the function.
 * 2. Check if it is greater than 50.
 *    If yes, then print "Nice job"
 * 3. If not, then check if it is greater than 25.
 *    If yes, then print "Not great, but okay."
 * 4. If not, then print "So bad, so very, very bad"
 * Input parameters: miles per gallon (float type)
 * Output: different string based on three categories of
 *    MPG: 50+, 25-49, and less than 25.
 * Returns: nothing
 */

void checkMPG(float mpg)
{
    if(mpg > 50) // check if the input value is greater than 50
    {
        cout << "Nice job" << endl; // output message
    }
    else if(mpg > 25) //if not, check if is greater than 25
    {
        cout << "Not great, but okay." << endl; // output message
    }
    else // for all other values
    {
        cout << "So bad, so very, very bad" << endl; // output message
    }
}
```

The following algorithm description does not mention in detail what the algorithm does and does not mention what value the function returns. Also, the solution is not commented. This would not receive full credit.

```
/**
 * Checks mpg
 */
void checkMPG(float mpg) {
    if(mpg > 50) {
        cout << "Nice job" << endl;
```

CSCI 1300 - Intro to Computer Programming

Instructor: Fleming/Gupta

Homework 2

```
    }
    else if(mpg > 25) {
        cout << "Not great, but okay." << endl;
    }
    else {
        cout << "So bad, so very, very bad" << endl;
    }
}
```

Test Cases (10 points)

Code compiles and runs (4 points):

- The zip file you submit to moodle should contain .cpp file(s) that can be compiled and run on Cloud9 with no errors. The functions should match those submitted to the autograder.
- You may create 3 separate files .cpp files with 1 function each, or produce 1 .cpp file with all 3 functions.

Test cases (6 points):

- Each function should have 2 test cases present in your main function(s), for a total of 6 test cases.
- If you choose to create separate files, you will need a main function in each file with the test cases for the function.

```
int main() {
    float mpg = 50.3;
    checkMPG(mpg); //test case 1 for checkMPG
    checkMPG(21.5); //test case 2 for checkMPG
}
```

The .cpp file(s) you submit should look something like this. Notice that this file has the required comments at the top of the file, an algorithm description, comments within the function, and two tests in main for the function checkMPG.

CSCI 1300 - Intro to Computer Programming

Instructor: Fleming/Gupta

Homework 2

The image shows a C++ IDE with a file named `mpg.cpp`. The code implements a function `checkMPG` that takes a float `mpg` and prints a message based on its value. The code is annotated with boxes and arrows pointing to specific features:

- Run button:** A green box highlights the `Run` button in the top toolbar, with the text "compiles and runs (4 points)".
- Comments:** A blue box highlights the multi-line comment at the top of the file, with the text "Comments (10 points)".
- Algorithm:** A purple box highlights the logic of the `checkMPG` function, with the text "Algorithm (10 points)".
- Test cases:** An orange box highlights the `main` function where two test cases are executed, with the text "2 test cases per function (6 points)".

```
1 // Author: CSCI300 Fall 2017
2 // Recitation: 123 - Favorite TA
3 // Homework 2 - Problem # ...
4
5 #include <iostream>
6
7 using namespace std;
8
9 /**
10  * Algorithm: that checks what range a given MPG falls into.
11  * 1. Take the mpg value passed to the function.
12  * 2. Check if it is greater than 50.
13  *   If yes, then print "Nice job"
14  * 3. If not, then check if it is greater than 25.
15  *   If yes, then print "Not great, but okay."
16  * 4. If not, then print "So bad, so very, very bad"
17  * Input parameters: miles per gallon (float type)
18  * Output: different string based on three categories of
19  *   MPG: 50+, 25-49, and less than 25.
20  * Returns: nothing
21  */
22
23 void checkMPG(float mpg)
24 {
25     if(mpg > 50) // check if the input value is greater than 50
26     {
27         cout << "Nice job" << endl; // output message
28     }
29     else if(mpg > 25) //if not, check if is greater than 25
30     {
31         cout << "Not great, but okay." << endl; // output message
32     }
33     else // for all other values
34     {
35         cout << "So bad, so very, very bad" << endl; // output message
36     }
37 }
38
39
40 int main() {
41     float mpg = 50.3;
42     checkMPG(mpg); //test case 1 for checkMPG
43     mpg = 23;
44     checkMPG(mpg); //test case 2 for checkMPG
45 }
46
```

CSCI 1300 - Intro to Computer Programming

Instructor: Fleming/Gupta

Homework 2

Problems Set:

Write a **function** for each of the following problems. You are encouraged to write your solution first in Cloud9. You are required to submit a .cpp file with your functions and a main() function with 2 tests for each of your functions.

Problem 1

The U.S. Census provides information about the current U.S. population as well as approximate rates of change. Using those rates and the current US population, write an algorithm to calculate the U.S. population in exactly one year (365 days). Your function should return the result of your calculations.

Three rates of change are provided:

- There is a birth every 8 seconds
 - There is a death every 12 seconds
 - There is a new immigrant arriving in the US every 33 seconds
- Your function should have one input value: the current population as an **integer parameter**.
 - Your function should **return** the population in a year.
 - Your function should not print/display/output anything
 - Your function **MUST** be named **population**.

For example, given an initial population of 1,000,000, your function would return 3,269,636.

Problem 2

A day has 86,400 seconds (24*60*60). Your function should take in a parameter containing number of seconds and output (print to the console) the value in seconds, followed by the time as days, hours, minutes, and seconds for a 24- hour clock.

Example output:

```
70000 seconds is 0 days, 19 hours, 26 minutes, and 40 seconds.
```

- Your function should have one input value: the number of seconds as an **integer parameter**.
- Your function should print/display/output the value in seconds, followed by the time as days, hours, minutes, and seconds like the format given above.
- Your function should not **return** any value.
- Your function **MUST** be named **howLong**.

CSCI 1300 - Intro to Computer Programming

Instructor: Fleming/Gupta

Homework 2

Problem 3

In thermodynamics, the Carnot efficiency is the maximum possible efficiency of a heat engine operating between two reservoirs at different temperatures. The Carnot efficiency is given as

$$\eta = 1 - \frac{T_C}{T_H}$$

, where T_C and T_H are the absolute temperatures at the cold and hot reservoirs, respectively. Write a function **carnot** that will compute the Carnot efficiency.

- Your function should take the two input values: the two reservoir temperatures in Kelvin as **integer parameters**.
- Your function **MUST** be named **carnot**.
- Your function should **return** the value of the Carnot efficiency

For example, given initial temperatures of: $T_C = 294$ and $T_H = 1089$

$$\eta = 0.73$$

Submitting Your Code to the Autograder on Moodle

You must name the functions as indicated in each problem description. **Importantly, the *cout* formats provided for each problem are not suggestions – they MUST be followed precisely, word-for-word and including all punctuation marks**, otherwise the autograder will not recognize your results and you will not receive credit.

Remember that you must **also** submit a zip file to moodle with the .cpp file you wrote in Cloud9 to receive full points for this assignment.

What to do if you have questions

There are several ways to get help on assignments in 1300, and depending on your question, some sources are better than others.

- Piazza is a good place to post technical questions, such as how to get user input, or treat that input as an integer. When you answer other students' questions, please do not post your code.
- The Course Assistants (CAs) are also a good source of technical information.

CSCI 1300 - Intro to Computer Programming

Instructor: Fleming/Gupta

Homework 2

- If, *after reading the assignment write-up*, you need clarification on what you're being asked to do in the assignment, the TAs and the course instructors are better sources of information than Piazza or the CAs.
